

## Building the Future of Agentic AI For IT Management

Team Name : Vipers

Team Leader Name : Sanjay Chari

**Problem Statement :Service efficiency improvement for MSPs and IT Teams ;  
Enhance the efficiency and effectiveness of IT service delivery, for:  
Service request fulfillment efficiency**

## Brief about the Idea:

### AI-Powered ITSM Solution for MSPs and IT Teams :

Our platform utilizes autonomous AI agents, powered by Amazon Bedrock AgentCore, to fundamentally transform IT service management through the following capabilities:

- **Autonomous Incident Correlation:** AI agents automatically group related incidents, decreasing technician workload by significant percentage.
- **Proactive Monitoring with Predictive Analytics:** Issues are anticipated and prevented before they occur, increasing service efficiency by significant percentage.

## Brief about the Idea (cont'd)

- Intelligent Problem Management: The system automatically generates problem records based on incident patterns, in line with ITIL best practices.
- Multi-Agent Coordination: Three specialized agents collaborate seamlessly, eliminating the need for human intervention.
- Core Value: By leveraging AWS AI technologies, our solution turns reactive IT support into proactive, intelligent service delivery.

How different is it from any of the other existing ideas?  
Since it is different from Traditional ITSM Platforms (e.g., ServiceNow, Jira Service Management) where :

Incident correlation relies on manual processes, Problem identification is reactive, Decision-making is human-dependent.

Whereas in Our agentic AI-Driven Solution: we have-

- Autonomous Decision Making: Agents use Amazon Bedrock for independent decisions
- Predictive Intelligence: Issues are forecasted over x hours in advance
- Self-Learning: The system adapts thresholds based on prior outcomes
- Real-Time Multi-Agent Coordination: Agents resolve conflicts and collaborate instantly

- How does it solve the problem?

#### Enhancing Technician Productivity:

- Manual correlation workload is reduced by significant %
- Escalation risk is predicted proactively
- Problem record creation is fully automated

#### Optimizing Time Management:

- Predictive analytics help to prevent outages
- Incident grouping saves investigation hours
- Proactive alerts minimize emergency response times

#### Improving Service Fulfillment:

- Pattern recognition spots recurring issues
- Capacity planning helps avoid bottlenecks
- Problem resolution is autonomously orchestrated

- Unique Selling Proposition
- True Autonomous ITSM: Agents operate without human input
- AWS-Native Design: Built on Amazon Bedrock AgentCore for scalability
- Predictive Issue Prevention: Stops problems before they impact users
- ITIL-Compliant Automation: Fully automated, standards-based processes
- Multi-Agent Intelligence: Specialized agents make coordinated decisions

List of features offered by the solution

## **Key Features**

### Correlation Agent

- Uses ML for semantic incident matching
- Predicts escalation risks
- Performs batch correlation analysis
- Prioritizes critical infrastructure

### Monitoring Agent

- Detects issues proactively through anomaly identification
- Forecasts issues four hours in advance
- Recommends capacity adjustments in real-time
- Recognizes recurring anomaly patterns

### Problem Agent

- Analyzes patterns in systems, symptoms, and timing
- Autonomously creates problem records when criteria are met
- Orchestrates problem resolution activities
- Generates AI-based root cause hypotheses

## List of features offered by the solution (cont'd)

### Unified Dashboard

- Provides live status of agents
- Displays predictive alerts
- Tracks performance metrics and autonomous actions
- Offers interactive control over thresholds and settings

### Additional Features

- Agents improve accuracy with self-learning algorithms
- Ensures ITIL compliance
- Supports multi-tenant MSP environments
- Integrates with existing ITSM tools via API

 Autonomous AI agents for ITSM

**AI-Powered ITSM Solution**  
*Autonomous agents with predictive analytics for intelligent IT service management*

⚡ Key Capabilities

**Correlation Agent**

- Incident similarity analysis
- Escalation prediction
- Batch correlation mapping

**Monitoring Agent**

- Proactive issue detection
- Future issue prediction
- Capacity planning

**Problem Agent**

- Pattern recognition
- Autonomous problem creation
- Resolution orchestration

## Architecture diagram of the proposed solution

## Technologies used in the working prototype:

Python 3.11 - Core language

Streamlit - Dashboard framework

Pandas/NumPy - Data processing

Scikit-learn - ML algorithms

JSON - Sample data storage

Custom Algorithms - Correlation, anomaly detection, pattern analysis

Object-Oriented Design - Agent classes and models

Statistical Analysis - Similarity scoring

Technologies to be used in the solution:

Proposed Production (Future AWS Integration):

Amazon Bedrock AgentCore – Multi-agent orchestration

Amazon Q , Kiro – Intelligent processing, Coding

AWS Lambda, DynamoDB, S3 – Cloud infrastructure

SageMaker, Comprehend – Advanced AI/ML

Add as per the requirements for the hackathon:
